2026/04/02 v2.40.5

Abstract

Package to have METAPOST code typeset directly in a document with LuaTEX

Contents

1 Documentation

This package aims at providing a simple way to typeset directly METAPOST code in a document with LuaTEX. LuaTEX is built with the Lua mplib library, that runs METAPOST code. This package is basically a wrapper for the Lua mplib functions and some TEX functions to have the output of the mplib functions in the PDF.

Using this package is easy: in Plain, type your METAPOST code between the macros \mplibcode and \endmplibcode, and in LATEX in the mplibcode environment.

The resulting METAPOST figures are put in a TEX hbox with dimensions adjusted to the METAPOST code.

The code of luamplib is basically from the luatex-mplib.lua and luatex-mplib.tex files from ConTEXt. They have been adapted to LATEX and Plain by Elie Roux and Philipp Gesang and new functionalities have been added by Kim Dohyun. The most notable changes are:

- Possibility to use btex ... etex to typeset TEX code. textext ⟨*string*⟩ is a more versatile macro equivalent to TEX ⟨*string*⟩ from TEX.mp. TEX is also allowed and is a synonym of textext. The argument of mplib's primitive maketext will also be processed by the same routine.

- Possibility to use verbatimtex ... etex to run a TEX code. VerbatimTeX ⟨*string*⟩ is a more versatile macro corresponding to verbatimtex command. Of course the behavior cannot be the same as the stand-alone **mpost**, so that you cannot include \documentclass, \usepackage etc. When these TEX commands are found in verbatimtex ... etex, the entire code will be ignored.

  The treatment of verbatimtex command has changed a lot since v2.20: see below § 1.1.6.

- In the past, the package required PDF mode in order to have some output. Starting with v2.7 it works in DVI mode as well, though DVIPDFMx is the only DVI tool currently supported.

It seems to be convenient to divide the explanations of some more changes and cautions into three parts: TEX, METAPOST, and Lua interfaces.

1.1 TEX

1.1.1 \mplibforcehmode

When this macro is declared, every METAPOST figure box will be typeset in horizontal mode, so that \centering, \raggedleft etc. will have effects. \mplibnoforcehmode, being default for backward compatibility, reverts this setting.[1]

1.1.2 \everymplib{...}, \everyendmplib{...}

\everymplib and \everyendmplib redefine the Lua table entry containing METAPOST code which will be automatically inserted at the beginning and ending of each METAPOST code chunk.

```
\everymplib{ beginfig(0); }
\everyendmplib{ endfig; }
\begin{mplibcode}
  % beginfig/endfig not needed
  draw fullcircle scaled 1cm;
\end{mplibcode}
```

1.1.3 \mplibsetformat{plain|metafun}

There are (basically) two formats for METAPOST: *plain* and *metafun*. By default, the *plain* format is used, but you can set the format to be used by future figures at any time using \mplibsetformat {⟨*format name*⟩}.

N.B. As *metafun* is such a complicated format, we cannot support all the special effects provided by *metafun*. At least, however, transparency (actually opacity), shading (gradient colors) and transparency group are fully supported, and outlinetext is supported by our own alternative mpliboutlinetext (see below § 1.2.11). You can try other effects as well, though we did not fully tested their proper functioning.

[1] Actually these commands redefine \prependtomplibbox. So you can redefine this macro with anything suitable before a box. But see § 1.1.18 on Tagged PDF.

transparency (texdoc metafun § 8.2) Transparency is so simple that you can apply it to an object, with *plain* format as well as *metafun*, just by appending `withprescript "tr_transparency=⟨numeric⟩"` to the sentence. ($0 \leq \langle numeric \rangle \leq 1$)

From v2.36, `withtransparency` is available with *plain* format as well. See below § 1.2.4.

shading (texdoc metafun § 8.3) One thing worth mentioning about shading is: when a color expression is given in string type, it is regarded by **luamplib** as a color expression of TEX side. For instance, when `withshadecolors("orange", 2/3red)` is given, the first color `"orange"` will be interpreted as a **color**, **xcolor** or **l3color**'s expression.

From v2.36, shading is available with *plain* format as well with extended functionality. See below § 1.2.6.

transparency group (texdoc metafun § 8.8) As for transparency group, the current *metafun* document is not correct. The true syntax is:

```
draw <picture>|<path> asgroup <string>
```

where ⟨*string*⟩ should be `""` (empty), `"isolated"`, `"knockout"`, or `"isolated,knockout"`. Beware that currently many of the PDF rendering applications, except Adobe Acrobat, cannot properly render the isolated or knockout effect.

Transparency group is available with *plain* format as well with extended functionality. See below § 1.2.13.

1.1.4 `\mplibnumbersystem{scaled|double|decimal}`

Users can choose `numbersystem` option. The default value is `scaled`, which can be changed by declaring `\mplibnumbersystem{double}` or `\mplibnumbersystem{decimal}`.

1.1.5 `\mplibshowlog{enable|disable}`

Default: `disable`. When `\mplibshowlog{enable}`[2] is declared, log messages returned by the METAPOST process will be printed to the `.log` file. This is the TEX side interface for `luamplib.showlog`.

1.1.6 `\mpliblegacybehavior{enable|disable}`

Legacy behavior By default, `\mpliblegacybehavior{enable}` is already declared for backward compatibility, in which case TEX code in `verbatimtex ... etex` that comes just before `beginfig()` will be inserted before the following METAPOST figure box. In this way, each figure box can be freely moved horizontally or vertically. Also, a box number can be assigned to a figure box, allowing it to be reused later.[3]

```
\mplibcode
  verbatimtex \moveright 3cm etex; beginfig(0); ... endfig;
```

[2] As for user's setting, `enable`, `true` and `yes` are identical; all others are identical to `disable`.

[3] But the recommended way to reuse a figure is using `\mplibgroup` command. See below § 1.2.14.

```
  verbatimtex \leavevmode etex; beginfig(1); ... endfig;
  verbatimtex \leavevmode\lower 1ex etex; beginfig(2); ... endfig;
  verbatimtex \endgraf\moveright 1cm etex; beginfig(3); ... endfig;
\endmplibcode
```

N.B. `\endgraf` should be used instead of `\par` inside mplibcode environment.

On the other hand, TEX code in `verbatimtex ... etex` between `beginfig()` and `endfig` will be inserted after flushing out the METAPOST figure. An example:[4]

```
\mplibcode
  D := sqrt(2)**9;
  beginfig(0);
    draw fullcircle scaled D;
    VerbatimTeX("\gdef\Dia{" & decimal D & "}");
  endfig;
\endmplibcode
diameter: \Dia bp.
```

diameter: 22.62764bp.

New and recommended way By contrast, when `\mpliblegacybehavior{disable}` is declared, any `verbatimtex ... etex`, along with `btex ... etex`, will be run sequentially one by one. So, some TEX code in `verbatimtex ... etex` will have effect on `btex ... etex` codes thereafter.

```
\begin{mplibcode}
  beginfig(0);
    draw btex ABC etex;
    verbatimtex \bfseries etex;
    draw btex DEF etex shifted (1cm,0);    % bold face
    draw btex GHI etex shifted (2cm,0);    % bold face
  endfig;
\end{mplibcode}
```

ABC **DEF** **GHI**

1.1.7 `\mplibtextextlabel{enable|disable}`

Default: `disable`. `\mplibtextextlabel{enable}` enables the labels typeset via `textext` instead of `infont` operator. So, `label("my text", origin)` thereafter is exactly the same as `label(textext "my text", origin)`.

N.B. In the background, **luamplib** redefines `infont` operator so that the right side argument (the font part) is totally ignored. Therefore the left side arguemnt (the text part) will be typeset with the current TEX font.

From v2.35, however, the redefinition of `infont` operator has been revised: when the character code of the text argument is less than 32 (control characters), or is equal to 35 (#), 36 ($), 37 (%), 38 (&), 92 (\), 94 (^), 95 (_), 123 ({), 125 (}), 126 (~) or 127 (DEL), the original `infont` operator will be used instead of `textext` operator so that the font part will be honored. Despite the revision, please take care of `char` operator in the text argument, as this might bring unpermitted characters into TEX.

[4] But the recommended way to access METAPOST variables from TEX (or Lua) side is to use Lua code via `luamplib.instances`. For details see below § 1.3.2.

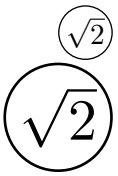
1.1.8 \mplibcodeinherit{enable|disable}

Default: disable. \mplibcodeinherit{enable} enables the inheritance of variables, constants, and macros defined by previous METAPOST code chunks. On the other hand, \mplibcodeinherit {disable} will make each code chunk being treated as an independent instance, never affected by previous code chunks.

1.1.9 \mplibglobaltextext{enable|disable}

Default: disable. Formerly, to inherit btex ... etex boxes as well as other METAPOST macros, variables and constants, it was necessary to declare \mplibglobaltextext{enable} in advance. But from v2.27, this is implicitly enabled when \mplibcodeinherit is enabled. The command still remains mostly for backward compatibility.

```
\mplibcodeinherit{enable}
%\mplibglobaltextext{enable}
\everymplib{ beginfig(0);} \everyendmplib{ endfig;}
\mplibcode
  label(btex $\sqrt{2}$ etex, origin);
  draw fullcircle scaled 20;
  picture pic; pic := currentpicture;
\endmplibcode
\mplibcode
  currentpicture := pic scaled 2;
\endmplibcode
```



1.1.10 Separate METAPOST instances

luamplib v2.22 has added the support for several named METAPOST instances in LaTeX environment mplibcode or Plain TeX commands \mplibcode ... \endmplibcode. The syntax for LaTeX is:

```
\begin{mplibcode}[instanceName]
  % some mp code
\end{mplibcode}
```

The behavior is as follows.

- All the variables and functions are shared only among all the environments belonging to the same instance.
- \mplibcodeinherit only affects the environments with no instance name set (since if a name is set, the code is intended to be reused at some point).
- btex ... etex boxes are also shared and do not require \mplibglobaltextext.
- When an instance names is set, respective \currentmpinstancename is set as well.

In parellel with this functionality, we support optional argument of instance name for \everymplib and \everyendmplib, affecting only those mplibcode environments of the same name.

Unnamed \everymplib affects not only those instances with no name, but also those with name but with no corresponding \everymplib. The syntax is:

```
\everymplib[instanceName]{...}
\everyendmplib[instanceName]{...}
```

1.1.11 \mplibverbatim{enable|disable}

Default: disable. Users can issue \mplibverbatim{enable}, after which the contents of mplibcode environment will be read verbatim. As a result, except for \mpdim and \mpcolor (see § 1.1.12 and § 1.1.13), all other TEX commands outside of the btex or verbatimtex ... etex are not expanded and will be fed literally to the **mplib** library.

1.1.12 \mpdim{...}

Besides other TEX commands, \mpdim is specially allowed in the mplibcode environment. This feature is inpired by **gmp** package authored by Enrico Gregorio. Please refer to the manual of **gmp** package for details.

```
draw origin--(.4\mpdim{\linewidth},0)
  withpen pencircle scaled 4 dashed evenly scaled 4
  withcolor \mpcolor{orange} ;
```

1.1.13 \mpcolor[...]{...}

With \mpcolor command, color names or expressions of **color**, **xcolor** and **l3color** module/packages can be used in the mplibcode environment (after withcolor command, in principle). See the example above at § 1.1.12. The optional [...] denotes the option of **xcolor**'s \color command. For spot colors, **l3color** module is well supported in PDF and DVI mode. Package **colorspace** is supported as well in PDF mode, but could conflict with **luamplib**'s special features such as shading when \DocumentMetadata, ie. PDF management code, is not loaded.

N.B. Formerly, only the first object would have been colored as intended among multiple graphical objects in a METAPOST image, because \mpcolor always produced withprescript command internally. Since v2.38.1, now that \mpcolor returns a METAPOST color expression if possible, users can issue the sentence as follows without worrying about the location of the color command:

```
draw image (drawarrow (left--right) scaled 5)
  scaled 8
  withcolor \mpcolor{red!50} ;
```

N.B. Be aware, however, that even after v2.38.1 \mpcolor still inserts withprescript command when the color specified is a spot color (or named color in DVI mode). Users therefore have to revise the code so that the color can have effect inside the image. For instance:

```
draw image (drawarrow (left--right) scaled 5)
  scaled 8
  withcolor \mpcolor{spotA}
  withoutcolor ;
```

or preferably,

```
draw image (drawarrow (left--right) scaled 5 withcolor \mpcolor{spotA})
  scaled 8 ;
```

1.1.14 \mpfig ... \endmpfig

Besides the mplibcode environment (for LaTeX) and \mplibcode ... \endmplibcode (for Plain), we also provide unexpandable TeX macros \mpfig ... \endmpfig and its starred version \mpfig* ... \endmpfig to save typing toil. The former is roughly the same as follows:

```
\begin{mplibcode}[@mpfig]
  beginfig(0)
    token list declared by \everymplib[@mpfig]
    ...
    token list declared by \everyendmplib[@mpfig]
  endfig;
\end{mplibcode}
```

and the starred version is roughly the same as follows:

```
\begin{mplibcode}[@mpfig]
  ...
\end{mplibcode}
```

In these macros \mpliblegacybehavior{disable} is forcibly declared. Again, as both share the same instance name, METAPOST codes are inherited among them. A simple example:

```
\everymplib[@mpfig]{ drawoptions(withcolor 1/3[red,white]); }
\mpfig* input boxes \endmpfig
\mpfig
  circleit.a(btex Box 1 etex); drawboxed(a);
\endmpfig
```

Users can change the instance name (default value: @mpfig) by redefining \mpfiginstancename, after which a new mplib instance will start and code inheritance too will begin anew. \let \mpfiginstancename\empty will prevent code inheritance if \mplibcodeinherit is not true.

1.1.15 About cache files

To support btex ... etex in external .mp files, luamplib inspects the content of each and every .mp file and makes caches if neceeccsary before returning their paths to the mplib library. This could waste the compilation time, as most .mp files do not contain btex ... etex commands. So luamplib provides macros as follows, so that users can give instructions about files that do not require this functionality.

- \mplibmakenocache{⟨*filename*⟩[,⟨*filename*⟩,...]}
- \mplibcancelnocache{⟨*filename*⟩[,⟨*filename*⟩,...]}

where ⟨*filename*⟩ is a filename without .mp extension. Note that .mp files under $TEXMFMAIN/metapost/base and $TEXMFMAIN/metapost/context/base are already registered by default.

N.B. \mplibmakenocache{*} will suppress making cache files. Use it at your own risk.

By default, cache files will be stored in $TEXMFVAR/luamplib_cache or, if it's not available (mostly not writable), in the directory where output files are saved: to be specific, $TEXMF_OUTPUT_DIRECTORY/luamplib_cache, ./luamplib_cache, $TEXMFOUTPUT/luamplib_cache, and ., in this order. $TEXMF_OUTPUT_DIRECTORY is normally the value of --output-directory command-line option.

Users can change this behavior by the command \mplibcachedir{⟨*directory path*⟩}, where tilde (~) is interpreted as the user's home directory (on a windows machine as well). As backslashes (\) should be escaped by users, it would be easier to use slashes (/) instead.

1.1.16 About figure box metric

Notice that, after each figure is processed, the macro \MPwidth stores the width value of the latest figure; \MPheight, the height value. Incidentally, also note that \MPllx, \MPlly, \MPurx, and \MPury store the bounding box information of the latest figure without the unit bp.

1.1.17 luamplib.cfg

At the end of package loading, **luamplib** searches luamplib.cfg and, if found, reads the file in automatically. Frequently used settings such as \everymplib, \mplibforcehmode or \mplibcodeinherit are suitable for going into this file.

1.1.18 Tagged PDF

When **tagpdf** package is loaded and activated, mplibcode environment accepts additional options for tagged PDF. The code related to this functionality is currently in experimental stage, not guaranteeing backward compatibility. Available optional keys are similar to those of the LaTeX's picture environment (texdoc latex-lab-graphic). The default tagging mode is the alt key with Figure structure.

alt=⟨*text*⟩ starts a Figure tag by default and sets an alternate text of the figure from the ⟨*text*⟩. BBox info will be added automatically to the PDF. This key is needed for ordinary METAPOST figures, for which, if no alt text is given, a default text will be used with a warning issued. You can change the alternate text within METAPOST code as well: VerbatimTeX "\mplibalttext{⟨*text*⟩}";

actualtext=⟨*text*⟩ starts a Span tag implicitly and sets a replacement text (a.k.a. actual text) from the ⟨*text*⟩. If in vertical mode, horizontal mode will be forced by \noindent command.[5] BBox info will not be added. This key is intended for figures which can be represented by a character or a small sequence of characters. You can change the actual text within METAPOST code as well: VerbatimTeX "\mplibactualtext{⟨*text*⟩}";

[5]It is not recommended to personally redefine \prependtomplibbox. Apart from using \mplibforcehmode or \mplibnoforcehmode, the redefinition might be incompatible with actualtext key. See § 1.1.1 on these commands.

artifact starts an `Artifact` MC (marked content). BBox info will not be added. This key is intended for decorative figures which have no semantic meaning.

text starts an `Artifact` MC but enables tagging on TEX-text boxes (such as `btex ... etex`, excluding pictures made by `infont` operator). If in vertical mode, horizontal mode will be forced by `\noindent` command.[6] BBox info will not be added. This key is intended for figures the meaning of which is the sequence of texts in the TEX-text boxes in the order they are drawn in the figure.

N.B. Inside `text`-mode figures, reusing TEX-text boxes is strongly discouraged.

Note that the text in a TEX-text box which starts with `[taggingoff]` will not be tagged at all, and of course `[taggingoff]` and its trailing spaces will be gobbled by **luamplib**. For example, the first and the third boxes in the following figure will not be tagged, and still remain in the `Artifact` MC-chunks.

```
\begin{mplibcode}[text]
  beginfig(1)
    draw btex [taggingoff] $\sqrt 2$ etex ;
    draw textext "$\sqrt 3$" shifted 12down ;
    draw TEX "[taggingoff] $\sqrt 5$" shifted 24down ;
    draw maketext "$\sqrt 7$" shifted 36down ;
    draw mplibgraphictext "$\sqrt x$" shifted 48down ;
  endfig;
\end{mplibcode}
```

$\sqrt{2}$
$\sqrt{3}$
$\sqrt{5}$
$\sqrt{7}$
$\sqrt{x}$

off Given this key, nothing will be tagged by **luamplib**.

tag=⟨*name*⟩ You can choose a tag name, default value being `Figure`.[7] For instance, you can set `tag=Formula, alt=`⟨*text*⟩ to get a `Formula` element with its alternate text.[8]

adjust-BBox=⟨*dimens*⟩ You can correct the BBox attribute of the figure by space-separated four dimensional values, which will be added to the automatically calculated BBox values. To draw the bounding box for checking with half-transparent red color, you can add `debug=BBox` to the argument of `\DocumentMetadata` command.

tagging-setup=⟨*key-val list*⟩ This key accepts as its value the list of key-value options mentioned so far.

You can set these options anywhere in the document by declaring `\SetKeys[luamplib/tagging]{`⟨*key-val list*⟩`}`, which will affect **mplib** figures thereafter in the scope. And the options listed above are provided for `\mpfig` and `\usemplibgroup` (see below § 1.2.13) commands as well.

```
\begin{mplibcode}[myInstanceName, alt=drawing of a circle]
  ...
```

[6] The key `text` also shares the limitation mentioned in the previous footnote.
[7] The option `tag=false`, however, is a synonym of the `off` key.
[8] Beware that this bypasses LATEX's regular math formula tagging, for which the `text` key is needed.

```
\end{mplibcode}

\mpfig[alt=drawing of a square box]
  ...
\endmpfig

\usemplibgroup[alt=drawing of a triangle]{...}

\mppattern{...}          % see below
  \mpfig[off]            % do not tag this figure
    ...
  \endmpfig
\endmppattern
```

As for the instance name of `mplibcode` environment, `instance=`⟨*name*⟩ or `instancename=`⟨*name*⟩ is also allowed in addition to the raw instance name as shown above.

1.2 MetaPost

1.2.1 `mplibdimen ..., mplibcolor ...`

`mplibdimen` ⟨*string*⟩ and `mplibcolor` ⟨*string*⟩ are METAPOST interfaces for the TEX commands `\mpdim` and `\mpcolor` (see above § 1.1.12 and § 1.1.13). For example, `mplibdimen "\linewidth"` is basically the same as `\mpdim{\linewidth}`, and `mplibcolor "red!50"` is basically the same as `\mpcolor{red!50}`. The difference is that these METAPOST operators can also be used in external `.mp` files, which cannot have TEX commands outside of the `btex` or `verbatimtex ... etex`.

1.2.2 `mplibtexcolor ..., mplibrgbtexcolor ...`

`mplibtexcolor` ⟨*string*⟩ is a METAPOST operator that converts a TEX color expression to a METAPOST color expression, that can be used anywhere color expression is expected as well as after the `withcolor` command.[9] For instance:

```
color col;
col := mplibtexcolor "olive!50";
```

But the result may vary in its color model (gray/rgb/cmyk) according to the given TEX color. Therefore the example shown above would raise a METAPOST error: `cmykcolor col;` should have been declared. By contrast, `mplibrgbtexcolor` ⟨*string*⟩ always returns rgb-model expressions.

N.B. Spot colors are forced to cmyk or rgb model, so these operators are not recommended for spot colors.

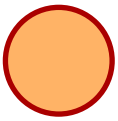
1.2.3 `withmplibcolors (..., ...)`

Unlike the `withcolor` command, users can specify one color for filling and another color for stroking using the macro `withmplibcolors` at the end of a sentence. The syntax is `withmplibcolors`

[9] Since v2.38.1, the operation of `mplibtexcolor` is the same as that of `mplibcolor` if the color specified is not a spot color or a named color in DVI mode.

(⟨*fill color expr*⟩, ⟨*stroke color expr*⟩). When the argument is in string type, it is regarded as the color expression of TEX side. A simple example (see also the example at § 1.2.10):

```
filldraw fullcircle scaled 40
  withpen pencircle scaled 2
  withmplibcolors ("orange!60", 2/3red) ;
```

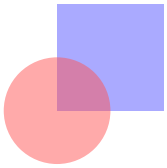


The PDF file size is much smaller than issueing two sentences with different colors, though the apparent effect is the same.

1.2.4 withtransparency (..., ...)

withtransparency(⟨*number*⟩ | ⟨*string*⟩, ⟨*numeric*⟩) is provided for *plain* format as well as *metafun*. The first argument accepts a number or a name among alternative transparency methods (see texdoc metafun § 8.2 Figure 8.1). The second argument accepts a numeric expression denoting opacity.

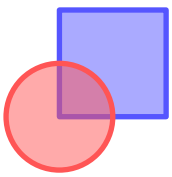
```
\mpfig
  fill unitsquare scaled 40
    withcolor 1/3[blue,white]
    withtransparency (1, 0.5)          % or ("normal", 0.5)
    ;
  fill fullcircle scaled 40
    withcolor 1/3[red,white]
    withtransparency (1, 0.5)
    ;
\endmpfig
```



1.2.5 withmplibopacities (..., ..., ...)

By analogy with the macro withmplibcolors (see above § 1.2.3), the macro withmplibopacities is also provided. The syntax is withmplibopacities (⟨*number*⟩ | ⟨*string*⟩, ⟨*numeric*⟩, ⟨*numeric*⟩). The first argument is the same as that of withtransparency command described above at § 1.2.4; the latter two arguments are numeric expressions denoting *fill opacity* and *stroke opacity* respectively. It is more efficient than issueing two sentences with different opacities.

```
\mpfig
  pickup pencircle scaled 2;
  filldraw unitsquare scaled 40
    withcolor 1/3[blue,white]
    withmplibopacities (1, 1/2, 1)      % or ("normal", 1/2, 1)
    ;
  filldraw fullcircle scaled 40
    withcolor 1/3[red,white]
    withmplibopacities (1, 1/2, 1)
    ;
\endmpfig
```



1.2.6 ... withshadingmethod ...

The syntax is exactly the same as *metafun*'s new shading method (texdoc metafun § 8.3.3), except that the 'shade' contained in each and every macro name has changed to 'shading' in luamplib: for instance, while withshademethod is a macro name which only works with *metafun* format, the equivalent provided by luamplib, withshadingmethod, works with *plain* as well. Other differences to the *metafun*'s and some cautions are:

- *Textual pictures* as well as paths can have shading effect. The term *textual picture* here means a picture generated by btex ... etex, textext, TEX, maketext, mplibgraphictext (see below § 1.2.8), or infont operator, though technically only the last one is a true textual picture. Note that the picture, including transparency group, in which the objects are filled *without* color can also be regarded as a textual picture (e.g., see below § 1.2.10, particularly the first example of tiling pattern at § 1.2.12; see also § 1.2.13 and § 1.2.14).

```
draw btex \bfseries\TeX etex rotated 15 scaled 6
  withshadingmethod "linear"
  withshadingvector (0,3)
  withshadingstep (
    withshadingfraction 1/2
    withshadingcolors (red,green)
  )
  withshadingstep (
    withshadingfraction 1
    withshadingcolors (green,blue)
  ) ;
```

- When shading a picture generated by 'infont' operator or that has multiple components, the effect of withshadingvector and that of withshadingdirection will be the same, as luamplib considers only the bounding box of the picture.
- Optional macro withshadingstroke is available (see below).

As shown, the syntax is ⟨*path*⟩ | ⟨*textual picture*⟩ withshadingmethod ⟨*string*⟩, where the latter shall be either "linear" or "circular". Other macros for optional values are:

withshadingvector ⟨***pair***⟩ Starting and ending points (as time value) on the path.

withshadingdirection ⟨***pair***⟩ Starting and ending points (as time value) on the bounding box. Default value: (0,2)

withshadingorigin ⟨***pair***⟩ The center of starting and ending circles. Default value: center p, where p is the operand of withshadingmethod.

withshadingradius ⟨***pair***⟩ Radii of starting and ending circles. This is no-op in linear mode. Default value: (0, abs(center p - urcorner p))

withshadingfactor ⟨***numeric***⟩ Multiplier of the radii. This is no-op in linear mode. Default value: 1.2

withshadingcenter ⟨***pair***⟩ Values for shifting starting center. For instance, `(0,0)` means that the center of starting circle is `center p`; `(1,1)` means `urcorner p`; `(-1,-1)` means `llcorner p`.

withshadingtransform ⟨***string***⟩ where ⟨*string*⟩ shall be `"yes"` (respect transform) or `"no"` (ignore transform). Default value: `"no"` for pictures made by `infont` operator or having multiple components; `"yes"` for all other cases.

withshadingdomain ⟨***pair***⟩ Limiting values of parametric variable that varies on the axis of color gradient. Default value is `(0,1)`. Of course the values can be negative or greater than 1.

withshadingstep (...) for combined shading of more than two colors.

withshadingfraction ⟨***numeric***⟩ Fractional number of each shading step. Only meaningful with `withshadingstep`.

withshadingcolors (⟨***color expr***⟩**,** ⟨***color expr***⟩**)** Starting and ending colors, default value being `(white, black)`. String-type argument is regarded as the color expression of TEX side.

withshadingstroke ⟨***string***⟩ where ⟨*string*⟩ shall be `"yes"` or `"no"`. Only meaningful when the shading object is a ⟨*path*⟩; if `"yes"`, we get the path stroked and *then* shaded. It is more efficient than issueing two sentences.

1.2.7 ... withfademethod ...

This is a METAPOST command which makes the color of an object gradiently transparent, a.k.a. *fading*. The syntax is ⟨*path*⟩ | ⟨*picture*⟩ `withfademethod` ⟨*string*⟩, the latter being either `"linear"` or `"circular"`. Though it is similar to the `withshademethod` from *metafun*, the differences are: (1) the object of fading can be a picture as well as a path; (2) you cannot make gradient colors, but can only make gradient opacity. Technically speaking, this command generates and applies a special kind of masking transparency group described below at § 1.2.15.

Related macros to control optional values are:

withfadeopacity (⟨***numeric***⟩**,** ⟨***numeric***⟩**)** sets the starting opacity and the ending opacity, default value being `(1,0)`. '`1`' denotes full color; '`0`' full transparency.

withfadevector (⟨***pair***⟩**,** ⟨***pair***⟩**)** sets the starting and ending points. Default value in the linear mode is `(llcorner p, lrcorner p)`, where `p` is the operand, meaning that fading starts from the left edge and ends at the right edge. Default value in the circular mode is `(center p, center p)`, which means centers of both starting and ending circles are the center of the bounding box.

withfadecenter is a synonym of `withfadevector`.

withfaderadius (⟨***numeric***⟩**,** ⟨***numeric***⟩**)** sets the radii of starting and ending circles. This is no-op in the linear mode. Default value is `(0, abs(center p - urcorner p))`, meaning that fading starts from the center and ends at the four corners of the bounding box.

withfadebbox (⟨*pair*⟩, ⟨*pair*⟩) sets the bounding box of the fading area, default value being `(llcorner p, urcorner p)`. Though this option is not needed in most cases, there could be cases when users want to explicitly control the bounding box. Particularly, see the description below at § 1.2.13 on the analogous macro `withgroupbbox`.

An example:

```
draw
  btex \includegraphics[width=100bp]{mill} etex
  withfademethod  "circular"
  withfaderadius  (20, 50)
  withfadeopacity (1, 0) ;
```

1.2.8 `mplibgraphictext ...`

`mplibgraphictext` ⟨*string*⟩ is a METAPOST operator, the effect of which is similar to that of ConTEXt's `graphictext` or our own `mpliboutlinetext` (see below § 1.2.11). However the syntax is somewhat different.

```
draw mplibgraphictext "$\sqrt{2+x}$"
  rotated 15 scaled 3
  fakebold 2.5                          % fontspec option
  fillcolor "red!50"                    % color expression
  drawcolor 2/3 red                     % or strokecolor 2/3 red
  ;
```

`fakebold`, `fillcolor` and `drawcolor` (or `strokecolor`) are optional; default values are `2`, `"white"` and `"black"` respectively.[10] When the color expression is given in string type, it is regarded as **color**, **xcolor** or **l3color**'s expression. All from `mplibgraphictext` to the end of sentence will compose an anonymous picture, which can be drawn or assigned to a variable. Incidentally, `withfillcolor` and `withdrawcolor` are synonyms of `fillcolor` and `drawcolor`, hopefully to be compatible with `graphictext`.

N.B. In some cases, especially when processing complicated TEX code, `mplibgraphictext` will produce better results than ConTEXt or even than our own `mpliboutlinetext`, not to mention the much smaller PDF file size. There are, however, some limitations such that you can't apply shading (gradient colors) to the text with *metafun*'s `withshademethod`.[11] Again, in DVI mode, **unicode-math** package is needed for math formulae, as we cannot embolden type1 fonts in DVI mode. But the most critical limitation is that, unlike `mpliboutlinetext`, you cannot manipulate the shape of outline paths, because the returned picture is basically a `btex ... etex` picture.

1.2.9 `mplibglyph ... of ...`

METAPOST operator `mplibglyph` ⟨*number*⟩ | ⟨*string*⟩ `of` ⟨*number*⟩ | ⟨*string*⟩ returns a METAPOST picture containing outline paths of a glyph in OpenType, TrueType or Type1 (`.pfb`) fonts. When a TFM font is specified, METAPOST primitive `glyph` will be called.

```
mplibglyph 50  of \fontid\font          % slot 50 of current font
```

[10] Users can use the `withmplibcolors` macro instead of `fillcolor` and `drawcolor` options. See § 1.2.3 on this macro.

[11] But this limitation is now lifted by the introduction of `withshadingmethod`. See above § 1.2.6.

```
mplibglyph "Q" of "TU/TeXGyrePagella(0)/m/n/10"      % font csname
mplibglyph "Q" of "texgyrepagella-regular.otf"       % raw filename
mplibglyph "R" of "utmr8a.pfb"                       % raw filename (type1 font)
mplibglyph "Q" of "Times.ttc(2)"                     % subfont number
mplibglyph "Q" of "SourceHanSansK-VF.otf[Regular]"   % instance name
mplibglyph "R" of "SourceHanSansK-VF.otf[wght=800]"  % axis names & values
```

Both arguments before and after 'of' can be either a number or a string. Number arguments are regarded as a glyph slot (GID) and a font id number, repectively. String argument at the left side is regarded as a glyph name in the font or a unicode character. String argument at the right side is regarded as a TEX font csname (without backslash) or the raw filename of a font. When it is a font filename, a number within parentheses after the filename denotes a subfont number (starting from zero) of a TTC font; a string within brackets denotes an instance name, or names and values for axis feature, of a variable font.

N.B. Regrettably we seem have some bug in processing a few glyphs in cmr10.pfb and its family (or maybe other) Type1 fonts. If that happens, consider using glyph instead of mplibglyph.

1.2.10 mplibdrawglyph ..., mplibstrokeglyph ..., mplibfillandstrokeglyph ...

As the structure of the picture returned by mplibglyph is quite similar to the result of glyph primitive, METAPOST's draw command will fill the inner path of the picture with the background color. In contrast, mplibdrawglyph ⟨*picture*⟩ command fills the paths according to the nonzero winding number rule. As a result, for instance, the area surrounded by inner path of "O" will remain transparent.

N.B. To apply the nonzero winding number rule to a picture containing paths, luamplib appends withpostscript "collect" to the paths except the last one in the picture. If you want the even-odd rule instead, you can additionally declare withpostscript "evenodd" to the last path.

N.B. By the way, when you want fill-and-stroke effect, issueing filldraw command to the last path will not always produce what you want: in such cases, you have to issue the command draw ⟨*the last path*⟩ withpostscript "both" (or "eoboth" to apply even-odd rule).[12]

As this could be somewhat annoying to users, luamplib v2.38.0 or later provides the following commands as well: mplibfillandstrokeglyph ⟨*picture*⟩, mplibstrokeglyph ⟨*picture*⟩, and mplibfillglyph ⟨*picture*⟩, the last one being a synonym of mplibdrawglyph command.

An example:

```
mplibfillandstrokeglyph
  mplibglyph "R" of \fontid\font scaled 1/12
  withpen pencircle scaled 1
  withmplibcolors ("orange", 2/3red) ;
```

1.2.11 mpliboutlinetext (...)

As said before at § 1.1.3, luamplib provides the METAPOST operator mpliboutlinetext (⟨*string*⟩) which mimicks *metafun*'s outlinetext, but with some enhancements including the support for

[12] *metafun* provides macros nofill, eofill, fillup, eofillup etc. (see *metafun* manual § 2.11), which luamplib with *plain* format does not provide currently.

right-to-left writing direction. The syntax is the same as that of *metafun*: see the *metafun* documentation § 8.7 (texdoc metafun).

A simple example:

```
draw mpliboutlinetext.b ("$\sqrt{2+\alpha}$")
  (withcolor \mpcolor{red!50})
  (withpen pencircle scaled .25 withcolor 2/3red)
  scaled 3 ;
```

After the process, mpliboutlinepic[] and mpliboutlinenum will be preserved as global variables; mpliboutlinepic[1] ... mpliboutlinepic[mpliboutlinenum] will be an array of images, each of which containing outline paths of a glyph or a rule.

N.B. As Unicode grapheme cluster is not considered in the array, a unit that must be a single cluster might be separated apart.

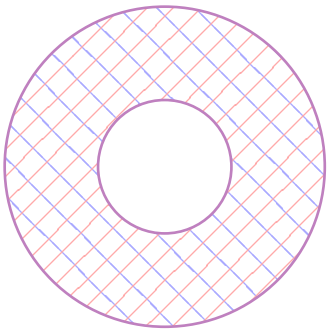
1.2.12 \mppattern{...} ... \endmppattern, ... withmppattern ...

TEX macros \mppattern{⟨*name*⟩} ... \endmppattern define a tiling pattern cell associated with the ⟨*name*⟩. METAPOST command withmppattern, the syntax being ⟨*cyclic path*⟩ | ⟨*textual picture*⟩ withmppattern ⟨*string*⟩, will fill the given path or text with the tiling pattern cell of the ⟨*name*⟩ by replicating it horizontally and vertically.[13] As said before at § 1.2.6, the *textual picture* here means any text typeset by TEX, mostly the result of the btex command (and its derivatives) or the infont operator.

An example:

```
\mppattern{mypatt}              % or \begin{mppattern}{mypatt}
  [                             % options: see below
    xstep = 10,
    ystep = 7,
    matrix = "rotated 45",      % or "0.7 0.7 -0.7 0.7" or {0.7, 0.7, -0.7, 0.7}
  ]
  \mpfig                        % or any other TeX code
    draw (up--down) scaled 5
      withcolor 2/3[blue,white] ;
    draw (left--right) scaled 5
      withcolor 2/3[red,white] ;
  \endmpfig
\endmppattern                   % or \end{mppattern}

\mpfig
  mplibdrawglyph image(
      draw fullcircle scaled 120;
      draw reverse fullcircle scaled 50;
    )
    withmppattern "mypatt"
```



[13] withpattern is an operator virtually the same as withmppattern, but the former forces a METAPOST picture. Therefore you cannot but use draw command with withpattern operator. On the other hand, ⟨*cyclic path*⟩ withmppattern ⟨*string*⟩ works as intended only with fill or filldraw command.

Table 1: options for \mppattern

Key	Value Type	Explanation
xstep	*number*	horizontal spacing between pattern cells
ystep	*number*	vertical spacing between pattern cells
xshift	*number*	horizontal shifting of pattern cells
yshift	*number*	vertical shifting of pattern cells
bbox	*table* or *string*	llx, lly, urx, ury values*
matrix	*table* or *string*	xx, yx, xy, yy values* or MP transform code
resources	*string*	PDF resources if needed
colored or coloured	*boolean*	false for uncolored pattern. default: true

* in string type, numbers are separated by spaces

```
    withpen pencircle scaled 1
    withcolor \mpcolor{red!50!blue!50} ;
\endmpfig
```

The available options, actually elements of a Lua *table*, are listed in Table 1. For the sake of convenience, the width and height values of the tiling pattern cell will be written down into the log file (depth is always zero). Users can refer to them for option setting.

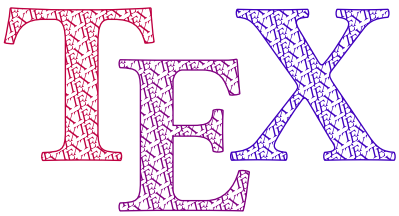
As for matrix option, METAPOST code such as "rotated 30 slanted .2" is allowed as well as the string or table of four numbers. You can also set xshift and yshift values by using 'shifted' operator. But when xshift or yshift option is explicitly given, they have precedence over the effect of 'shifted' operator.

When you use special effect such as transparency in a pattern cell, resources option is needed: for instance, resources="/ExtGState 1 0 R". However, as luamplib automatically includes the resources of the current page, this option is not needed in most cases.

Option colored=false (or coloured=false) will generate an uncolored pattern cell which shall have no color at all (i.e. withoutcolor command is needed for METAPOST code).[14] Uncolored pattern will be painted later by the color of a METAPOST object. An example:

```
\begin{mppattern}{pattnocolor}
  [
    colored = false,
    matrix = "slanted .3 rotated 30",
  ]
  \tiny\TeX
\end{mppattern}

\begin{mplibcode}
  beginfig(1)
    picture tex;
    tex = mpliboutlinetext.p ("\bfseries \TeX");
    for i=1 upto mpliboutlinenum:
```



[14] When using DVI mode, -c option might be needed to the dvipdfmx command.

```
      mplibfillandstrokeglyph mpliboutlinepic[i]
        scaled 8
        withmppattern "pattnocolor"
        withpen pencircle scaled 1/2
        withcolor (i/4)[red,blue]      % paints the pattern
        ;
    endfor
  endfig;
\end{mplibcode}
```

A much simpler and efficient way to obtain a similar result (but without colorful characters in this example) is to give a *textual picture* as the operand of `withmppattern`:

```
\begin{mplibcode}
  beginfig(2)
    draw mplibgraphictext "\bfseries\TeX"
      fakebold 1/2
      rotated 15 scaled 8
      withmppattern "pattnocolor"
      withmplibcolors (
        2/3[red,white],               % paints the pattern
        2/3 red
      ) ;
  endfig;
\end{mplibcode}
```

1.2.13 ... asgroup ...

As said before at § 1.1.3, transparency group is available with *plain* as well as *metafun*. It is called *Transparency Group* because the objects contained in the group are composited to produce a single object, so that outer transparency effect, if any, will be applied to the group as a whole, not to the individual objects cumulatively.

The syntax is basically the same as *metafun*'s: ⟨*picture*⟩ | ⟨*path*⟩ `asgroup ""` | `"isolated"` | `"knockout"` | `"isolated,knockout"` | `"off"`, which will return a METAPOST picture. The additional features provided by luamplib are:

- As shown, in addition to those arguments mimicking *metafun*'s, we allow another argument at the right-hand side: `asgroup "off"` will produce an ordinary *Form XObject* rather than a transparency group XObject. On the contrary, `asgroup ""` (empty string) will produce a transparency group in which both of the PDF keys `/I` and `/K` are `false`.
- You can reuse the group as many times as you want in the TEX code or in other METAPOST code chunks, with infinitesimal increase in the size of PDF file. For this functionality we provide TEX and METAPOST macros as follows:

withgroupname ⟨***string***⟩ associates a transparency group with the given name. When this is not appended to the sentence with `asgroup` operator, the default group name '`lastmplibgroup`' will be used.

\usemplibgroup{⟨*name*⟩} is a TEX command to reuse a transparency group of the name once used. Note that the position of the group will be origin-based: in other words, lower-left corner of the bounding box will be shifted to the origin.

usemplibgroup ⟨***string***⟩ is a METAPOST command which will add a transparency group of the name to the currentpicture. Contrary to the TEX command just mentioned, the position of the group is the same as the original transparency group.

withgroupbbox (⟨*pair*⟩, ⟨*pair*⟩) sets the bounding box of the transparency group, default value being (llcorner p, urcorner p). This option might be needed especially when you draw with a thick pen a path that touches the boundary; you would probably want to append to the sentence 'withgroupbbox (bot lft llcorner p, top rt urcorner p)', supposing that the pen was selected by the pickup command.

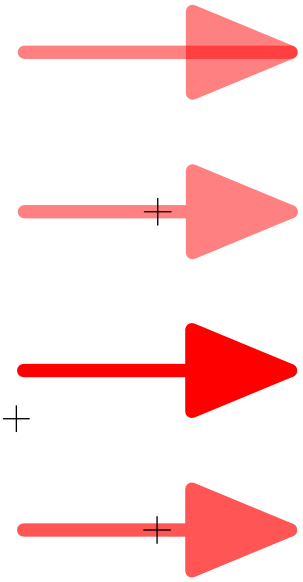
An example showing the effect of transparency group and the difference between the TEX and METAPOST commands:

```
\mpfig
  picture pic;
  pic = image(drawarrow (left--right) scaled 5 withcolor red) scaled 10 ;
  draw pic
    asgroup "off"
    withtransparency (1, 1/2) ;
\endmpfig

\mpfig
  draw pic
    asgroup ""
    withgroupname "mygroup"
    withtransparency (1, 1/2) ;
  draw (left--right) scaled 5 ;
  draw (up--down) scaled 5 ;
\endmpfig

\noindent
\clap{\vrule width 10bp height .25bp depth .25bp}%
\clap{\vrule width .5bp height 5bp depth 5bp}%
\usemplibgroup{mygroup}

\mpfig
  usemplibgroup "mygroup"
    withtransparency (1, 2/3) ;
  draw (left--right) scaled 5 ;
  draw (up--down) scaled 5 ;
\endmpfig
```



Also note that normally the transparency groups are not affected by outer color commands. However, if you have made the original transparency group using withoutcolor command, colors will have effects on the uncolored objects in the group.

Table 2: options for \mplibgroup

Key	Value Type	Explanation
asgroup	*string*	"", "isolated", "knockout", "isolated,knockout", "masking" or "off"
bbox	*table* or *string*	llx, lly, urx, ury values*
matrix	*table* or *string*	xx, yx, xy, yy values* or MP transform code
resources	*string*	PDF resources if needed

* in string type, numbers are separated by spaces

N.B. Shading effect upon a *textual picture* (ie. non-path object) inside transparency group may not produce the intended outcome. Outer shading effect has no problem.

1.2.14 \mplibgroup{...} ... \endmplibgroup

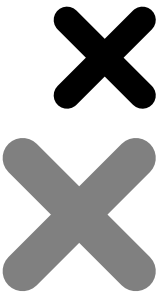
These TEX macros are described here in this subsection, as they are deeply related to the asgroup operator described just above at § 1.2.13. Users can define a transparency group or an ordinary *form XObject* with these macros from TEX side. The syntax is similar to the \mppattern command (see above § 1.2.12).

An example:

```
\mplibgroup{mygrx}                  % or \begin{mplibgroup}{mygrx}
  [                                 % options: see below
    asgroup="",
  ]
  \mpfig                            % or any other TeX code
    pickup pencircle scaled 10;
    draw (left--right) scaled 20 rotated 45 ;
    draw (left--right) scaled 20 rotated -45 ;
  \endmpfig
\endmplibgroup                      % or \end{mplibgroup}

\usemplibgroup{mygrx}

\mpfig
  usemplibgroup "mygrx" scaled 1.5
    withtransparency (1, 0.5) ;
\endmpfig
```



Availabe options, much fewer than those for \mppattern, are listed in Table 2. Again, the width/height/depth values of the mplibgroup will be written down into the log file.

When asgroup option is not given or is given as "off", an ordinary form XObject will be generated rather than a transparency group. Thus the individual objects, not the XObject as a whole, will be affected by outer transparency command, just like the first figure in the example above at § 1.2.13.

As for the option asgroup="masking", see the next subsection § 1.2.15.

As shown, you can reuse the mplibgroup using the TEX command \usemplibgroup or the METAPOST command usemplibgroup. The behavior of these commands is the same as that de-

scribed above at § 1.2.13, excepting that the mplibgroup made by TEX code (not by METAPOST code) respects original height and depth.

1.2.15 ... withmaskinggroup ...

Using this command, the mplibgroup (see above § 1.2.14) generated by the option `asgroup="masking"` (see Table 2) can be utilized as a masking transparency group upon a picture or a path object. The syntax is ⟨*picture*⟩ | ⟨*path*⟩ `withmaskinggroup` ⟨*string*⟩, the latter being the name of a pre-defined masking group.

The masking group should be prepared in *grayscale* color model: the area painted with `1` (white) will preserve the full color of the object; the area painted with `0` (black) will force full transparency, making it invisible.[15]

By default, the background color of a masking group is `0` (black), which you can change by this macro:

withmaskingbgcolor ⟨***numeric***⟩ sets the background color of the masking group. `0` denotes full transparency (invisibility); `1`, full color.

N.B. Tiling pattern (see above § 1.2.12) is not allowed in the masking group, whereas the tiling pattern in the object of `withmaskinggroup` is no problem.

An example:

```
\mpfig*
  picture pic;
  pic = image(
      fill fullcircle scaled 80 withcolor blue ;
      fill fullcircle scaled 80 shifted (25,0) withcolor green ;
      fill fullcircle scaled 80 shifted (50,0) withcolor red ;
    );
\endmpfig

\mplibgroup{mymask}[asgroup="masking"]
  \mpfig
    label(TEX "\sffamily\bfseries\scshape\Huge Meta" scaled 2, center pic)
      withcolor 1 ;
  \endmpfig
\endmplibgroup

\mpfig
  fill bbox pic
    withshadingmethod "linear"
    withshadingcolors (red, blue) ;
  draw pic
    withmaskinggroup "mymask"
    withmaskingbgcolor 1/10
```

[15] In fact, colors in other color models are also allowed (such as `white`, `black`, `red`, `green`, `blue`). But they will be converted to grayscale model by the PDF renderer.

```
    withtransparency (1, 0.8) ;
\endmpfig
```

1.2.16 mpliblength ..., mplibuclength ...

mpliblength ⟨*string*⟩ returns the number of unicode characters in the string. This is a unicode-aware version equivalent to the METAPOST primitive length, but accepts only a string-type argument. For instance, mpliblength "abçdéf" returns 6, not 8.

On the other hand, mplibuclength ⟨*string*⟩ returns the number of unicode grapheme clusters in the string. For instance, mplibuclength "Äpfel", where Ä is encoded using two codepoints (U+0041 and U+0308), returns 5, not 6 or 7. This operator requires lua-uni-algos package.

1.2.17 mplibsubstring ... of ..., mplibucsubstring ... of ...

mplibsubstring ⟨*pair*⟩ of ⟨*string*⟩ is a unicode-aware version equivalent to the METAPOST's substring ... of ... primitive. The syntax is the same as the latter, but the string is indexed by unicode characters. For instance, mplibsubstring (2,5) of "abçdéf" returns "çdé", and mplibsubstring (5,2) of "abçdéf" returns "édç".

On the other hand, mplibucsubstring ⟨*pair*⟩ of ⟨*string*⟩ returns the part of the string indexed by unicode grapheme clusters. For instance, mplibucsubstring (0,1) of "Äpfel", where Ä is encoded using two codepoints (U+0041 and U+0308), returns "Ä", not "A". This operator requires lua-uni-algos package.

1.3 Lua

1.3.1 runscript ...

A good many METAPOST macros described in this documentation have been implemented using the primitive runscript. With runscript ⟨*string*⟩, you can run a Lua code chunk from METAPOST side and get some METAPOST code returned by Lua if you want. As the functionality is provided by the mplib library itself, luamplib does not have much to say about it.

One thing is worth mentioning, however: if you return a Lua *table* to the METAPOST process, it is automatically converted to a relevant METAPOST data type such as pair, color, cmykcolor or transform. So users can save some extra toil of converting a table to a string, though it's not a big deal. For instance, runscript "return {1,0,0}" will give you the METAPOST color expression (1,0,0) automatically.

1.3.2 Lua table luamplib.instances

Users can access the Lua table containing mplib instances, luamplib.instances, through which METAPOST variables are also easily accessible from Lua side, as documented in LuaTEX manual § 11.2.8.4 (texdoc luatex). The following example will print false, 3.0, MetaPost and the knots and the cyclicity of the path unitsquare.

```
\begin{mplibcode}[myinstance]
  boolean b; b = 1 > 2;
```

```
  numeric n; n = 3;
  string s;  s = "MetaPost";
  path p;    p = unitsquare;
\end{mplibcode}

\directlua{
  local myinstance = luamplib.instances.myinstance
  print( myinstance:get_boolean "b" )
  print( myinstance:get_numeric "n" )
  print( myinstance:get_string  "s" )
  local t = myinstance:get_path "p"
  for k,v in pairs(t) do
    print(k, type(v)=='table' and table.concat(v,' ') or v)
  end
}
```

Of course, this sort of Lua code can also be run inside METAPOST code using `runscript` command. Again, of course you can access a METAPOST variable using your own TEX macro. For example:

```
\def\mpnumeric#1#2{\directlua{
  tex.sprint(tostring(luamplib.instances["#1"]:get_numeric"#2"))
}}
\mpnumeric{myinstance}{n}\relax                                    3.0
```

1.3.3 Lua function `luamplib.process_mplibcode`

Users can run a METAPOST code chunk from Lua side by using this function:

```
luamplib.process_mplibcode (<string> metapost code, <string> instance name)
```

The second argument cannot be absent, but can be an empty string (`""`) which means that it has no instance name.

Some other elements in the `luamplib` namespace, listed in Table 3, can affect the process of `process_mplibcode`.

1.3.4 Lua function `luamplib.registerpattern`

This is the Lua interface for `\mppattern` ... `\endmppattern` described above at § 1.2.12.

```
luamplib.registerpattern (<number> box register, <string> pattern name, <table> options)
```

The first argument is the register of a box containing a pattern cell, which should be prepared in advance by the user. For instance, `\setbox0=\hbox{\tiny\TeX}`, or corresponding Lua code using `tex.setbox` function; then the argument should be `0`.

As for the third argument, see above Table 1. The argument cannot be absent, but can be an empty table, i.e. `{ }`.

Table 3: elements in luamplib table (partial)

Key	Type	Related TEX macro	Cf.

1.3.5 Lua function `luamplib.registergroup`

This is the Lua interface for \mplibgroup ... \endmplibgroup described above at § 1.2.14.

```
luamplib.registergroup (<number> box register, <string> group name, <table> options)
```

The first argument is the register of a box prepared in advance by the user. When the contents of the box have been generated from TEX (not METAPOST) code, please make sure that both of the TEX macros 'MPllx' and 'MPlly' are defined as '0' before invoking the Lua function.

As for the third argument, see above Table 2. The argument cannot be absent, but can be an empty table, i.e. { }.

Reusing an mplibgroup, \usemplibgroup{⟨*name*⟩}, is basically the same as running the TEX macro 'luamplib.group.⟨*name*⟩'. If you need the boxresource index, inspect this macro using token.get_macro function.

2 Implementation

2.1 Lua module

```
1
2 luatexbase.provides_module {
3   name          = "luamplib",
4   version       = "2.40.5",
5   date          = "2026/04/02",
6   description   = "Lua package to typeset Metapost with LuaTeX's MPLib.",
7 }
8
```

Use the luamplib namespace, since mplib is for the METAPOST library itself. ConTEXt uses metapost.

```
luamplib          = luamplib or { }
local luamplib    = luamplib

local format, abs = string.format, math.abs

```

Use our own function for warn/info/err.

```
local function termorlog (target, text, kind)
  if text then
    local mod, write, append = "luamplib", texio.write_nl, texio.write
    kind = kind
        or target == "term" and "Warning (more info in the log)"
        or target == "log" and "Info"
        or target == "term and log" and "Warning"
        or "Error"
    target = kind == "Error" and "term and log" or target
    local t = text:explode"\n+"
    write(target, format("Module %s %s:", mod, kind))
    if #t == 1 then
      append(target, format(" %s", t[1]))
    else
      for _,line in ipairs(t) do
        write(target, line)
      end
      write(target, format("(%s)     ", mod))
    end
    append(target, format(" on input line %s", tex.inputlineno))
    write(target, "")
    if kind == "Error" then error() end
  end
end
local function warn (...) -- beware '%' symbol
  termorlog("term and log", select("#",...) > 1 and format(...) or ...)
end
local function info (...)
  termorlog("log", select("#",...) > 1 and format(...) or ...)
end
local function err (...)
  termorlog("error", select("#",...) > 1 and format(...) or ...)
end

luamplib.showlog  = luamplib.showlog or false

```

Provide a few “shortcuts” expected by the code.

```
local tableconcat = table.concat
local tableinsert = table.insert
local tableunpack = table.unpack
local texsprint   = tex.sprint
local texgettoks  = tex.gettoks
```

```
local texgetbox   = tex.getbox
local texruntoks  = tex.runtoks
if not texruntoks then
  err("Your LuaTeX version is too old. Please upgrade it to the latest")
end
local is_defined  = token.is_defined
local get_macro   = token.get_macro
local mplib = require ('mplib')
local kpse  = require ('kpse')
local lfs   = require ('lfs')
local lfsattributes = lfs.attributes
local lfsisdir      = lfs.isdir
local lfsmkdir      = lfs.mkdir
local lfstouch      = lfs.touch
local ioopen        = io.open

```

Some helper functions, prepared for the case when `l-file` etc is not loaded.

```
local file = file or { }
local replacesuffix = file.replacesuffix or function(filename, suffix)
  return (filename:gsub("%.[%a%d]+$","")) .. "." .. suffix
end
local is_writable = file.is_writable or function(name)
  if lfsisdir(name) then
    name = name .. "/_luam_plib_temp_file_"
    local fh = ioopen(name,"w")
    if fh then
      fh:close(); os.remove(name)
      return true
    end
  end
end
local mk_full_path = lfs.mkdirp or lfs.mkdirs or function(path)
  local full = ""
  for sub in path:gmatch("(/*[^\\/]+)") do
    full = full .. sub
    lfsmkdir(full)
  end
end

```

btex ... etex in input `.mp` files will be replaced in finder. Because of the limitation of **mplib** regarding `make_text`, we might have to make cache files modified from input files.

First of all, determine the directory to store cache files.

```
local cachedir
local function outputdir ()
  if lfstouch then
    for i,v in ipairs{'TEXMFVAR','TEXMF_OUTPUT_DIRECTORY','.','TEXMFOUTPUT'} do
      local var = i == 3 and v or kpse.var_value(v)
      if var and var ~= "" then
```

```
      for _,vv in ipairs(var:explode(os.type == "unix" and ":" or ";")) do
        local dir = format("%s/%s",vv,"luamplib_cache")
        if not lfsisdir(dir) then
          mk_full_path(dir)
        end
        if is_writable(dir) then
          cachedir = dir; return cachedir
        end
      end
    end
  end
  cachedir = "."; return cachedir
end
function luamplib.getcachedir(dir)
  dir = dir:gsub("##","#")
  dir = dir:gsub("^~",
    os.type == "windows" and os.getenv("UserProfile") or os.getenv("HOME"))
  if lfstouch and dir then
    if lfsisdir(dir) then
      if is_writable(dir) then
        cachedir = dir
      else
        warn("Directory '%s' is not writable!", dir)
      end
    else
      warn("Directory '%s' does not exist!", dir)
    end
  end
end
```

Some basic METAPOST files not necessary to make cache files.

```
local noneedtoreplace = {
  ["boxes.mp"] = true, --  ["format.mp"] = true,
  ["graph.mp"] = true, ["marith.mp"] = true, ["mfplain.mp"] = true,
  ["mpost.mp"] = true, ["plain.mp"] = true, ["rboxes.mp"] = true,
  ["sarith.mp"] = true, ["string.mp"] = true, -- ["TEX.mp"] = true,
  ["metafun.mp"] = true, ["metafun.mpiv"] = true, ["mp-abck.mpiv"] = true,
  ["mp-apos.mpiv"] = true, ["mp-asnc.mpiv"] = true, ["mp-bare.mpiv"] = true,
  ["mp-base.mpiv"] = true, ["mp-blob.mpiv"] = true, ["mp-butt.mpiv"] = true,
  ["mp-char.mpiv"] = true, ["mp-chem.mpiv"] = true, ["mp-core.mpiv"] = true,
  ["mp-crop.mpiv"] = true, ["mp-figs.mpiv"] = true, ["mp-form.mpiv"] = true,
  ["mp-func.mpiv"] = true, ["mp-grap.mpiv"] = true, ["mp-grid.mpiv"] = true,
  ["mp-grph.mpiv"] = true, ["mp-idea.mpiv"] = true, ["mp-luas.mpiv"] = true,
  ["mp-mlib.mpiv"] = true, ["mp-node.mpiv"] = true, ["mp-page.mpiv"] = true,
  ["mp-shap.mpiv"] = true, ["mp-step.mpiv"] = true, ["mp-text.mpiv"] = true,
  ["mp-tool.mpiv"] = true, ["mp-cont.mpiv"] = true,
}
luamplib.noneedtoreplace = noneedtoreplace

```

Pattern formats to replace btex and verbatimtex ... etex in input files, if needed.

```
local name_b = "%f[%a_]"
local name_e = "%f[^%a_]"
local btex_etex = name_b.."btex"..name_e.."%s*(.-)%s*"..name_b.."etex"..name_e
local verbatimtex_etex = name_b.."verbatimtex"..name_e.."%s*(.-)%s*"..name_b.."etex"..name_e

```

Function luamplib.finder

```
local currenttime = os.time()
do
  local luamplibtime = lfsattributes(kpse.find_file"luamplib.lua", "modification")
```

format.mp is much complicated, so specially treated.

```
  local function replaceformatmp(file,newfile,ofmodify)
    local fh = ioopen(file,"r")
    if not fh then return file end
    local data = fh:read("*all"); fh:close()
    fh = ioopen(newfile,"w")
    if not fh then return file end
    fh:write(
      "let normalinfont = infont;\n",
      "primarydef str infont name = rawtextext(str) enddef;\n",
      data,
      "vardef Fmant_(expr x) = rawtextext(decimal abs x) enddef;\n",
      "vardef Fexp_(expr x) = rawtextext(\"$^{\"&decimal x&\"}$\") enddef;\n",
      "let infont = normalinfont;\n"
    ); fh:close()
    lfstouch(newfile,currenttime,ofmodify)
    return newfile
  end
  local function replaceinputmpfile (name,file)
    local ofmodify = lfsattributes(file,"modification")
    if not ofmodify then return file end
    local newfile = name:gsub("%W","_")
    newfile = format("%s/luamplib_input_%s", cachedir or outputdir(), newfile)
    if newfile and luamplibtime then
      local nf = lfsattributes(newfile)
      if nf and nf.mode == "file" and
        ofmodify == nf.modification and luamplibtime < nf.access then
        return nf.size == 0 and file or newfile
      end
    end
    if name == "format.mp" then return replaceformatmp(file,newfile,ofmodify) end
    local fh = ioopen(file,"r")
    if not fh then return file end
    local data = fh:read("*all"); fh:close()
```

“etex” must be preceded by a space and followed by a space or semicolon as specified in LuaTEX manual, which is not the case of standalone METAPOST though.

```
    local count,cnt = 0,0
    data, cnt = data:gsub(btex_etex, "btex %1 etex ") -- space
```

```
    count = count + cnt
    data, cnt = data:gsub(verbatimtex_etex, "verbatimtex %1 etex;") -- semicolon
    count = count + cnt
    if count == 0 then
      noneedtoreplace[name] = true
      fh = ioopen(newfile,"w");
      if fh then
        fh:close()
        lfstouch(newfile,currenttime,ofmodify)
      end
      return file
    end
    fh = ioopen(newfile,"w")
    if not fh then return file end
    fh:write(data); fh:close()
    lfstouch(newfile,currenttime,ofmodify)
    return newfile
  end
```

As the finder function for **mplib**, use the kpse library and make it behave like as if METAPOST was used. And replace `.mp` files with cache files if needed. See also #74, #97.

```
  local mpkpse
  do
    local exe = 0
    while arg[exe-1] do
      exe = exe-1
    end
    mpkpse = kpse.new(arg[exe], "mpost")
  end
  local special_ftype = {
    pfb = "type1 fonts",
    enc = "enc files",
  }
  function luamplib.finder (name, mode, ftype)
    if mode == "w" then
      if name and name ~= "mpout.log" then
        kpse.record_output_file(name) -- recorder
      end
      return name
    else
      ftype = special_ftype[ftype] or ftype
      local file = mpkpse:find_file(name,ftype)
      if file then
        if lfstouch and ftype == "mp" and not noneedtoreplace[name] and not noneedtoreplace["*.mp"] then
          file = replaceinputmpfile(name,file)
        end
      else
        file = mpkpse:find_file(name, name:match("%a+$"))
      end
```

```
      if file then
        kpse.record_input_file(file) -- recorder
      end
      return file
    end
  end
end

```

For the main function: process

plain or *metafun*, though we cannot support *metafun* format fully.

```
local currentformat = "plain"
function luamplib.setformat (name)
  currentformat = name
end
```

v2.9 has introduced the concept of "code inherit"

```
luamplib.codeinherit = false
local mplibinstances = {}
luamplib.instances = mplibinstances
local has_instancename = false

local process
do
  local function reporterror (result, prevlog)
    if not result then
      err("no result object returned")
    else
      local t, e, l = result.term, result.error, result.log
```

log has more information than term, so log first (2021/08/02)

```
      local log = l or t or "no-term"
      log = log:gsub("%(Please type a command or say `end'%)",""):gsub("\n+","\n")
      if result.status > 0 then
        local first = log:match"(.-\n! .-)\n! "
        if first then
          termorlog("term", first)
          termorlog("log", log, "Warning")
        else
          warn(log)
        end
        if result.status > 1 then
          err(e or "see above messages")
        end
      elseif prevlog then
        log = prevlog..log
```

v2.6.1: now luamplib does not disregard show command, even when luamplib.showlog is false. Incidentally, it does not raise error nor prints an info, even if output has no figure.

```
        local show = log:match"\n>>? .+"
        if show then
```

```
277           termorlog("term", show, "Info (more info in the log)")
278           info(log)
279         elseif luamplib.showlog and log:find"%g" then
280           info(log)
281         end
282       end
283       return log
284     end
285   end
```

`lualibs-os.lua` installs a randomseed. When this file is not loaded, we should explicitly seed a unique integer to get random randomseed for each run.

```
286   if not math.initialseed then math.randomseed(currenttime) end
287   local function luamplibload (name)
288     local mpx = mplib.new {
289       ini_version = true,
290       find_file   = luamplib.finder,
```

Make use of `make_text` and `run_script`. And we provide `numbersystem` option since v2.4. See https://github.com/lualatex/luamplib/issues/21.

```
291       make_text   = luamplib.maketext,
292       run_script  = luamplib.runscript,
293       math_mode   = luamplib.numbersystem,
294       job_name    = tex.jobname,
295       random_seed = math.random(4095),
296       utf8_mode   = true,
297       extensions  = 1,
298     }
```

Append our own METAPOST preamble to the preamble loading plain/metafun format.

```
299     local preamble = tableconcat{
300       format(luamplib.preambles.preamble, replacesuffix(name,"mp")),
301       luamplib.preambles.mplibcode,
302       luamplib.legacyverbatimtex and luamplib.preambles.legacyverbatimtex or "",
303       luamplib.textextlabel and luamplib.preambles.textextlabel or "",
304     }
305     local result, log
306     if not mpx then
307       result = { status = 99, error = "out of memory"}
308     else
309       result = mpx:execute(preamble)
310     end
311     log = reporterror(result)
312     return mpx, result, log
313   end
```

Here, excute each `mplibcode` data, ie `\begin{mplibcode} ... \end{mplibcode}`.

```
314   function process (data, instancename)
315     local currfmt
316     if instancename and instancename ~= "" then
317       currfmt = instancename
```

```
      has_instancename = true
    else
      currfmt = tableconcat{
        currentformat,
        luamplib.numbersystem or "scaled",
        tostring(luamplib.textextlabel),
        tostring(luamplib.legacyverbatimtex),
      }
      has_instancename = false
    end
    local mpx = mplibinstances[currfmt]
    local standalone = not (has_instancename or luamplib.codeinherit)
    if mpx and standalone then
      mpx:finish()
    end
    local log = ""
    if standalone or not mpx then
      mpx, _, log = luamplibload(currentformat)
      mplibinstances[currfmt] = mpx
    end
    local converted, result = false, {}
    if mpx and data then
      result = mpx:execute(data)
      local log = reporterror(result, log)
      if log then
        if result.fig then
          converted = luamplib.convert(result)
        end
      end
    else
      err"Mem file unloadable. Maybe generated with a different version of mplib?"
    end
    return converted, result
  end
end

```

dvipdfmx is supported, though nobody seems to use it.

```
local pdfmode = tex.outputmode > 0

```

make_text and some run_script uses LuaTEX's tex.runtoks.

```
local catlatex = luatexbase.registernumber("catcodetable@latex")
local catat11  = luatexbase.registernumber("catcodetable@atletter")
```

tex.scantoks sometimes fail to read catcode properly, especially \#, \&, or \%. After some experiment, we dropped using it. Instead, a function containing tex.sprint seems to work nicely.

```
local function run_tex_code (str, cat)
  texruntoks(function() texsprint(cat or catlatex, str) end)
end
```

For conversion of sp to bp.

```
local factor = 65536*(7227/7200)

```

Prepare textext box number containers, locals and globals. `localid` can be any number. They are local anyway. The number will be reset at the start of a new code chunk. Global boxes will use `\newbox` command in `tex.runtoks` process. This is the same when `codeinherit` is true. Boxes in instances with name will also be global, so that their tex boxes can be shared among instances of the same name.

```
local texboxes = { globalid = 0, localid = 4096 }
local process_tex_text
do
  local textext_fmt = 'image(addto currentpicture doublepath unitsquare \z
    xscaled %f yscaled %f shifted (0,-%f) \z
    withprescript "mplibtexboxid=%i:%f:%f")'
  function process_tex_text (str, maketext)
    if str then
      if not maketext then str = str:gsub("\r.-$","") end
      local global = (has_instancename or luamplib.globaltextext or luamplib.codeinherit)
                     and "\\global" or ""
      local tex_box_id
      if global == "" then
        tex_box_id = texboxes.localid + 1
        texboxes.localid = tex_box_id
      else
        local boxid = texboxes.globalid + 1
        texboxes.globalid = boxid
        run_tex_code(format([[\expandafter\newbox\csname luamplib.box.%s\endcsname]], boxid))
        tex_box_id = tex.getcount'allocationnumber'
      end
      if str:find"^%[taggingoff%]" then
        str = str:gsub("^%[taggingoff%]%s*","")
        run_tex_code(format("\\luamplibnotagtextboxset{%i}{%s\\setbox%i\\hbox{%s}}",
                            tex_box_id, global, tex_box_id, str))
      else
        run_tex_code(format("\\luamplibtagtextboxset{%i}{%s\\setbox%i\\hbox{%s}}",
                            tex_box_id, global, tex_box_id, str))
      end
      local box = texgetbox(tex_box_id)
      local wd  = box.width  / factor
      local ht  = box.height / factor
      local dp  = box.depth  / factor
      return textext_fmt:format(wd, ht+dp, dp, tex_box_id, wd, ht+dp)
    end
    return ""
  end
end

```

Make `color` or `xcolor`'s color expressions usable, with `\mpcolor` or `mplibcolor`. These commands should be used with graphical objects. Attempt to support l3color as well.

```
if is_defined'color_select:n' then
  run_tex_code{
    "\\newcatcodetable\\luamplibcctabexplat",
    "\\begingroup",
    "\\catcode`@=11 ",
    "\\catcode`_=11 ",
    "\\catcode`:=11 ",
    "\\savecatcodetable\\luamplibcctabexplat",
    "\\endgroup",
  }
end
local ccexplat = luatexbase.registernumber"luamplibcctabexplat"

local process_color, process_mplibcolor
```

A common function for color functions

```
local function colorsplit (res)
  local t, tt = { }, res:gsub("[%[%]]","",2):explode()
  local be = tt[1]:find"^%d" and 1 or 2
  for i=be, #tt do
    if not tonumber(tt[i]) then break end
    t[#t+1] = tt[i]
  end
  if #t == 0 then -- named color in DVI mode with no DocumentMetadata
    run_tex_code{"\\extractcolorspecs{", tt[3], "}\\mplibtmpa\\mplibtmpb"}
    t = get_macro"mplibtmpb":explode","
  end
  return t
end
do
  local colfmt = ccexplat and "l3color" or "xcolor"
  local mplibcolorfmt = {
    xcolor = tableconcat{
      [[\begingroup\let\XC@mcolor\relax]],
      [[\def\set@color{\global\mplibtmptoks\expandafter{\current@color}}]],
      [[\color%s\endgroup]],
    },
    l3color = tableconcat{
      [[\begingroup\def\__color_select:N#1{\expandafter\__color_select:nn#1}]],
      [[\def\__color_backend_select:nn#1#2{\global\mplibtmptoks{#1 #2}}]],
      [[\def\__kernel_backend_literal:e#1{\global\mplibtmptoks\expandafter{\expanded{#1}}}]],
      [[\color_select:n%s\endgroup]],
    },
  }
  function process_color (str)

  data = format("\n%s\n%s\n%s\n",everymplib, data, everyendmplib)
  :gsub("\r","\n")
```

These five lines are needed for mplibverbatim mode.

```
  if luamplib.verbatiminput then
```

```
    data = data:gsub("\\mpcolor%s+(.-%b{})","mplibcolor(\"%1\")")
    :gsub("\\mpdim%s+(%b{})", "mplibdimen(\"%1\")")
    :gsub("\\mpdim%s+(\\%a+)","mplibdimen(\"%1\")")
    :gsub(btex_etex, "btex %1 etex ")
    :gsub(verbatimtex_etex, "verbatimtex %1 etex;")
  else
```

If not `mplibverbatim`, expand `mplibcode` data, so that users can use TEX codes in it. It has turned out that no comment sign is allowed. However, we do not expand `btex ... etex`, `verbatimtex ... etex`, and string expressions.

```
    local t = { } -- to store btex, verbatimtex, string
    data = data:gsub(btex_etex, function(str)
      t[#t+1] = str
      return format("btex \\unexpanded{!l!u!a!%s!m!p!l!} etex ",  #t) -- space
    end)
    :gsub(verbatimtex_etex, function(str)
      t[#t+1] = str
      return format("verbatimtex \\unexpanded{!l!u!a!%s!m!p!l!} etex;", #t) -- semicolon
    end)
    :gsub('"(.-)"', function(str)
      t[#t+1] = str
      return format('"\\unexpanded{!l!u!a!%s!m!p!l!}"', #t)
    end)
    :gsub("\\%%", "\0PerCent\0")
    :gsub("%%.-\n","\n")
    :gsub("%zPerCent%z", "\\%%")
    run_tex_code(format("\\mplibtmptoks\\expandafter{\\expanded{%s}}",data))
    data = texgettoks"mplibtmptoks"
```

Next line to address issue #55

```
    :gsub("##", "#")
    :gsub("!l!u!a!(%d+)!m!p!l!", function(str) return t[tonumber(str)] or str end)
  end
  process(data, instancename)
end

```

pdfliterals will be stored in `figcontents` table, and written to pdf in one go at the end of the flushing figure. Subtable `post` is for the legacy behavior.

```
local figcontents = { post = { } }
local function put2output(a,...)
  figcontents[#figcontents+1] = type(a) == "string" and format(a,...) or a
end
local function pdf_startfigure(n,llx,lly,urx,ury)
  put2output("\\mplibstarttoPDF{%f}{%f}{%f}{%f}",llx,lly,urx,ury)
end
local function pdf_stopfigure()
  put2output("\\mplibstoptoPDF")
end
```

tex.sprint with catcode regime -2, as sometimes # gets doubled in the argument of pdfliteral.

```
local function pdf_literalcode (...)
  put2output{ -2, (format(...) :gsub(decimals,rmzeros)) }
end
local start_pdf_code = pdfmode
  and function() pdf_literalcode"q" end
  or  function() put2output"\\special{pdf:bcontent}" end
local stop_pdf_code = pdfmode
  and function() pdf_literalcode"Q" end
  or  function() put2output"\\special{pdf:econtent}" end

```

Now we process hboxes created from btex ... etex or textext(...) or TEX(...) etc.

```
local function put_tex_boxes (object,prescript)

```
  end

```

Finally, flush figures by inserting PDF literals.

```
  local function flush (result,flusher)
    if result then
      local figures = result.fig
      if figures then
        for f=1, #figures do
          info("flushing figure %s",f)
          local figure = figures[f]
          local objects = figure:objects()
          local fignum = tonumber(figure:filename():match("([%d]+)$") or figure:charcode() or 0)
          local miterlimit, linecap, linejoin, dashed = -1, -1, -1, false
          local bbox = figure:boundingbox()
          local llx, lly, urx, ury = bbox[1], bbox[2], bbox[3], bbox[4] -- faster than unpack
          if urx < llx then
```

luamplib silently ignores this invalid figure for those that do not contain `beginfig ... endfig`. (issue #70) Original code of ConTEXt general was:

```
-- invalid
pdf_startfigure(fignum,0,0,0,0)
pdf_stopfigure()
```

```
          else
```

For legacy behavior, insert 'pre-fig' TEX code here.

```
            if tex_code_pre_mplib[f] then
              put2output(tex_code_pre_mplib[f])
            end
            pdf_startfigure(fignum,llx,lly,urx,ury)
            start_pdf_code()
            if objects then
              local savedpath = nil
              local savedhtap = nil
              for o=1,#objects do
                local object        = objects[o]
                local objecttype    = object.type
```

The following 10 lines are part of `btex...etex` patch. Again, colors are processed at this stage.

```
                local prescript     = object.prescript
                prescript = prescript and script2table(prescript) -- prescript is now a table

  end
end
```

2.2 TEX package

First we need to load some packages.

```
\ifcsname ProvidesPackage\endcsname
```

We need LATEX 2024-06-01 as we use `ltx.pdf.object_id` when pdfmanagement is loaded. But as fp package does not accept an option, we do not append the date option.

```
  \NeedsTeXFormat{LaTeX2e}
  \ProvidesPackage{luamplib}
    [2026/04/02 v2.40.5 mplib package for LuaTeX]
\fi
\ifdefined\newluafunction\else
  \input ltluatex
\fi
```

In DVI mode, a new XObject (mppattern, mplibgroup) must be encapsulated in an `\hbox`. But this should not affect typesetting. So we use Hook mechanism provided by LATEX kernel.

In Plain, atbegshi.sty is loaded.

```
\ifnum\outputmode=0
  \ifdefined\AddToHookNext
    \def\luamplibatnextshipout{\AddToHookNext{shipout/background}}
    \def\luamplibatfirstshipout{\AddToHook{shipout/firstpage}}
    \def\luamplibateveryshipout{\AddToHook{shipout/background}}
  \else
    \input atbegshi.sty
    \def\luamplibatnextshipout#1{\AtBeginShipoutNext{\AtBeginShipoutAddToBox{#1}}}
    \let\luamplibatfirstshipout\AtBeginShipoutFirst
    \def\luamplibateveryshipout#1{\AtBeginShipout{\AtBeginShipoutAddToBox{#1}}}
  \fi
\fi
```

Loading of lua code.

```
\directlua{require("luamplib")}
```

legacy commands. Seems we don't need it, but no harm.

```
\ifx\pdfoutput\undefined
  \let\pdfoutput\outputmode

2025/12/05: \begin{center}\mpfig ...\endmpfig\end{center} raises an Error! as we issue \everypar{} before flushing literals out. It is related to \partokencontext=2 recently introduced by LaTeX. Why we used vbox initially? where hbox seems to be sufficient. Anyway, among various solutions including \partokencontext\z@, \let\par\@@par, and \endgraf, we here attempt to address the issue by adding the following line, which LaTeX's \everypar should have done.

```

```

That's all folks!

3 The GNU GPL License v2

The GPL requires the complete license text to be distributed along with the code. I recommend the canonical source, instead: http://www.gnu.org/licenses/old-licenses/gpl-2.0.html. But if you insist on an included copy, here it is. You might want to zoom in.

GNU GENERAL PUBLIC LICENSE

Version 2, June 1991

51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA

Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software—to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

Terms and Conditions For Copying, Distribution and Modification

1. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The "Program", below, refers to any such program or work, and a "work based on the Program" means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term "modification".) Each licensee is addressed as "you".

   Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

2. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

   You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

3. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:

   (a) You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.

   (b) You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.

   (c) If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

   These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

   Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

   In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

4. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:

   (a) Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   (b) Accompany it with a written offer, valid for at least three years, to give any third party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

   (c) Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

   The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

   If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

5. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

6. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.

7. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.

8. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

   If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

   It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

   This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

9. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.

10. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

    Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and "any later version", you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

11. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

No Warranty

12. Because the program is licensed free of charge, there is no warranty for the program, to the extent permitted by applicable law. Except when otherwise stated in writing the copyright holders and/or other parties provide the program "as is" without warranty of any kind, either expressed or implied, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The entire risk as to the quality and performance of the program is with you. Should the program prove defective, you assume the cost of all necessary servicing, repair or correction.

13. In no event unless required by applicable law or agreed to in writing will any copyright holder, or any other party who may modify and/or redistribute the program as permitted above, be liable to you for damages, including any general, special, incidental or consequential damages arising out of the use or inability to use the program (including but not limited to loss of data or data being rendered inaccurate or losses sustained by you or third parties or a failure of the program to operate with any other programs), even if such holder or other party has been advised of the possibility of such damages.

End of Terms and Conditions

Appendix: How to Apply These Terms to Your New Programs

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the "copyright" line and a pointer to where the full notice is found.

> one line to give the program's name and a brief idea of what it does.
> Copyright (C) yyyy name of author
>
> This program is free software; you can redistribute it and/or modify it under the terms of the GNU General Public License as published by the Free Software Foundation; either version 2 of the License, or (at your option) any later version.
>
> This program is distributed in the hope that it will be useful, but WITHOUT ANY WARRANTY; without even the implied warranty of MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the GNU General Public License for more details.
>
> You should have received a copy of the GNU General Public License along with this program; if not, write to the Free Software Foundation, Inc., 51 Franklin Street, Fifth Floor, Boston, MA 02110-1301, USA.

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

> Gnomovision version 69, Copyright (C) yyyy name of author
> Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type 'show w'.
> This is free software, and you are welcome to redistribute it under certain conditions; type 'show c' for details.

The hypothetical commands `show w` and `show c` should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than `show w` and `show c`; they could even be mouse-clicks or menu items—whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a "copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

> Yoyodyne, Inc., hereby disclaims all copyright interest in the program 'Gnomovision' (which makes passes at compilers) written by James Hacker.
>
> signature of Ty Coon, 1 April 1989
> Ty Coon, President of Vice

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.
